Degradation

- **Rapid performance drop, deeper the network**

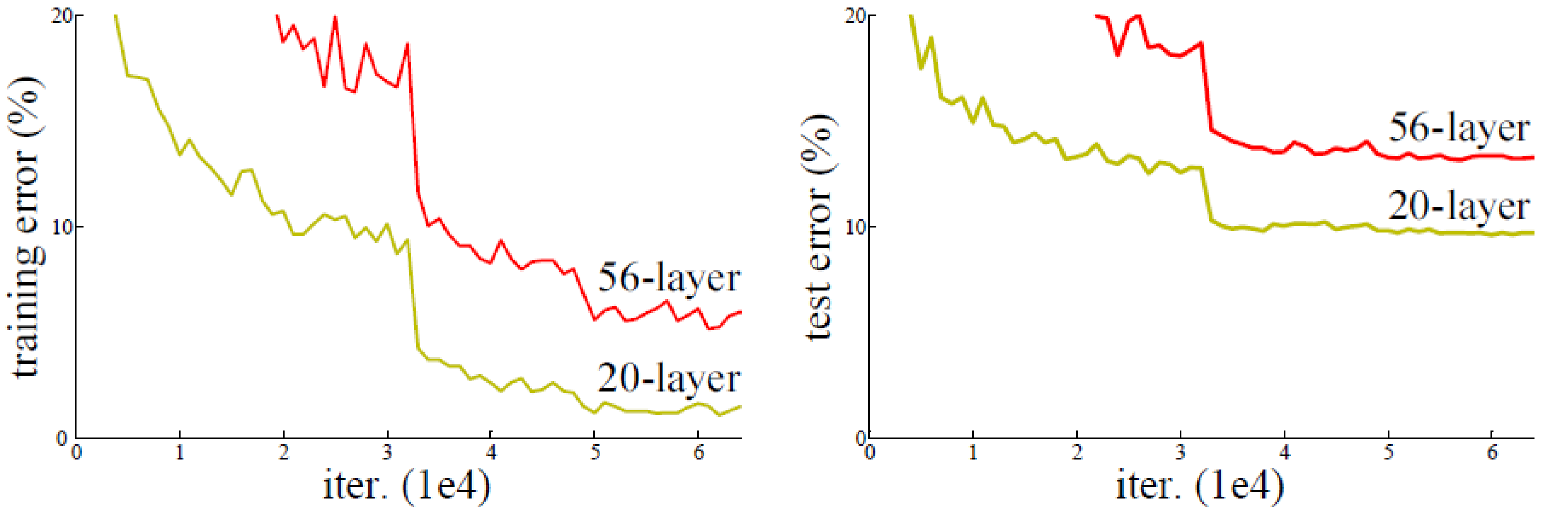

Figure 1. Training error (left) and test error (right) on CIFAR-10 with 20-layer and 56-layer "plain" networks. The deeper network has higher training error, and thus test error. Similar phenomena on ImageNet is presented in Fig. 4.

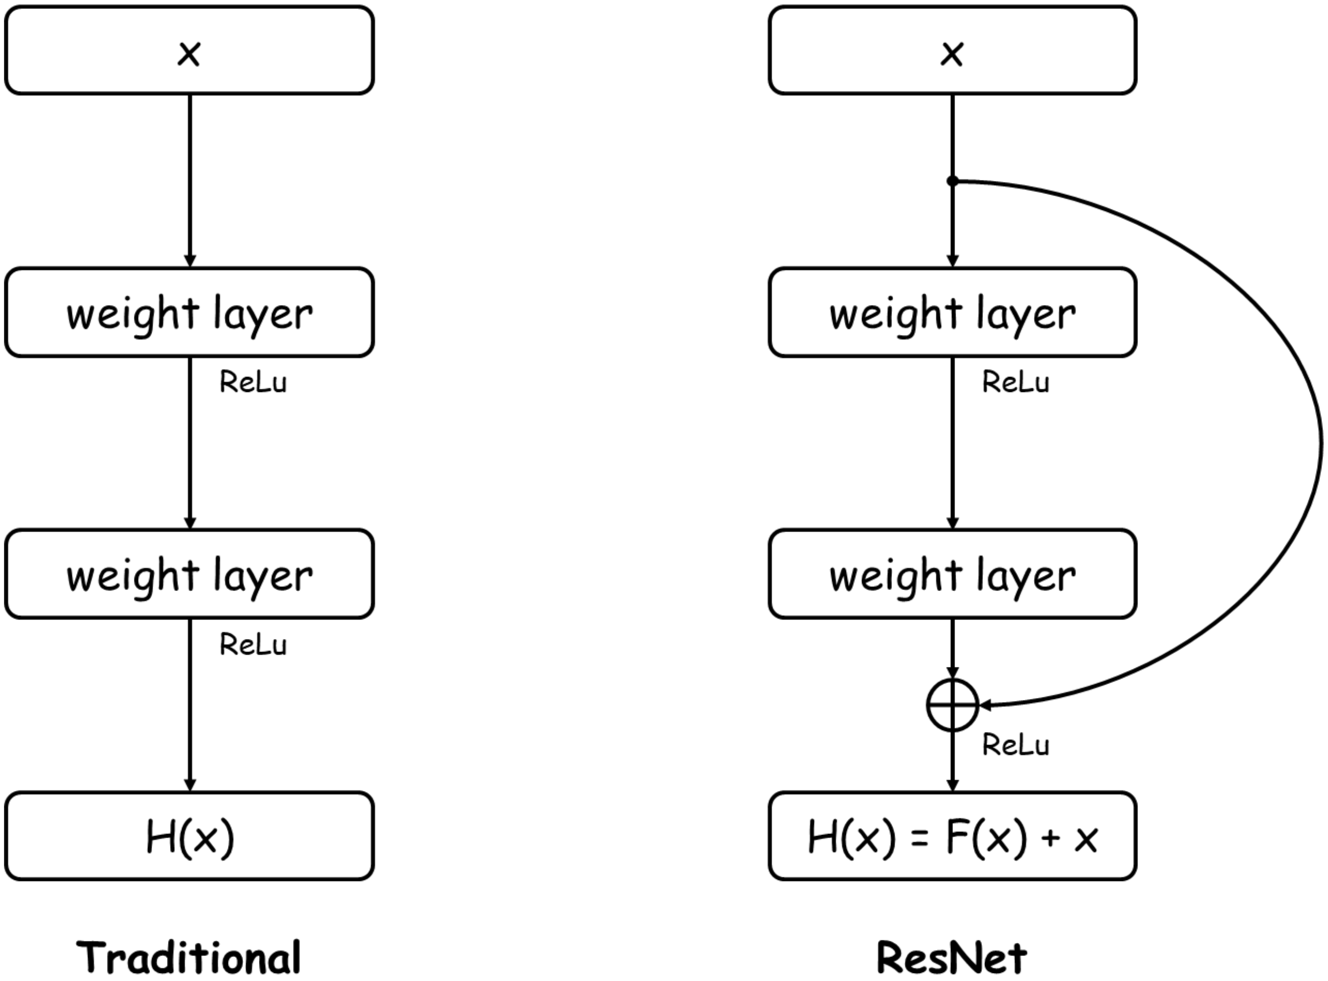
Skip Connection



Skip Connection

- **Traditional NN's goal**
  - Find function H(x) that maps x to y
- **ResNet's goal**
  - Minimize H(x)
  - x is fixed (because x is input)
  - Therefore, minimizing F(x) leads to minimizing H(x)
  - Same as minimizing H(x) – x, because F(x) = H(x) – x
  - H(x) – x is called **"residual"** because it represents the difference between output and input

Architecture

- **When input and output have the same feature map size, use the same size filter**
- **When feature map size is halved, number of filters are doubled**
- **Down-sampling is done by giving 2-stride**
